

Power Calculations for Correlates of Risk (Single-dose Approach) Adherence Scen. 1

Power is computed as the proportion of the ~1000 one-sided 2.5%-level tests to reject the null hypotheses.
 'Wald/Conc.' uses a daily grid for controls; 'Cox PH Model/Conc.' uses a single record for cases and a daily grid for controls.
 annual incidence rate = 0.04, imperfect adherence assumed,
 prob_misInfu = 0.1, prob_misVis = 0.15, r_infuDiscont = 0.15, r_dropout = 0.15
